ABSTRACT

Our proposed system is an online food ordering system that enables ease for the customers. It overcomes the disadvantages of the traditional queueing system. Our proposed system is a medium to order online food hassle free from restaurants as well as mess service.

This system improves the method of taking the order from customer. The online food ordering system sets up a food menu online and customers can easily place the order as per their wish. Also with a food menu, customers can easily track the orders.

This system also provides a feedback system in which user can rate the food items. Also, the proposed system can recommend hotels, food, based on the ratings given by the user, the hotel staff will be informed for the improvements along with the quality. The payment can be made online or pay-on-delivery system. For more secured ordering separate accounts are maintained for each user by providing them an ID and a password.

INTRODUCTION

1.1 General Introduction to the topic

The online food ordering system sets up a food menu online and customers can easily place the order as per they like. Also with a food menu, online customers can easily track the orders. The management maintains customers database, and improve food delivery service. The Restaurant management systems motivates us to develop the system. There are various facilities provided so that the users of the system will get service effectively. Also, the system considers Restaurants as well as Mess facility to the customers.

Again, the idea comes that mostly mess users are person who are shifted for various reason in new cities. So, they are interrelated. Increasing use of smart phones is also considered as a motivation, so that any users of this system get all service on single click. Another motivation can be considered as the system will be designed to avoid users doing fatal errors, users can change their own profile, users can track their food items through GPS, users can provide feedback and recommendations and can give ratings, it will give appropriate feedbacks to Restaurants / Mess service providers.

Why Online Food Order System -

Due to lack of a full fledged application that can fulfill the customer requirements by providing him food from restaurants as well as from mess service, there is a need for the system. This proposed system will be used by the people who keep shifting from cities to cities. As well as, it will be useful for the students studying in different cities. The proposed system will provide the flexibility to the Customers/Users to order from either Restaurants or Mess. It will also provide Recommendations to the customers from the restaurants/mess owners uploaded on a daily basis. In the proposed system, there will be no limitation on the amount of order the customer wants. Also, same application can be used as a Startup Business for the developers. It will provide real time customers feedback and ratings along with the comments to the restaurants/mess owner. It gives appropriate feedbacks to users, so if there is any error happened, then there will be a feedback dialog toward users.

The proposed system is designed to avoid users doing fatal errors and inappropriate action. Scope of proposed system is justifiable because in large amount of people are shifting to different cities so wide range of people can make a use of proposed system. The system/interface will take input from the user. The major attributes that will give input to the dataset are: name, address, email-Id, mobile no, other personal related values, etc. The output will include user/customer's Order, Bill, Feedback and Payment options. Initially there will be 10 to 12 restaurants and mess services considered inside 2 to 3 areas.

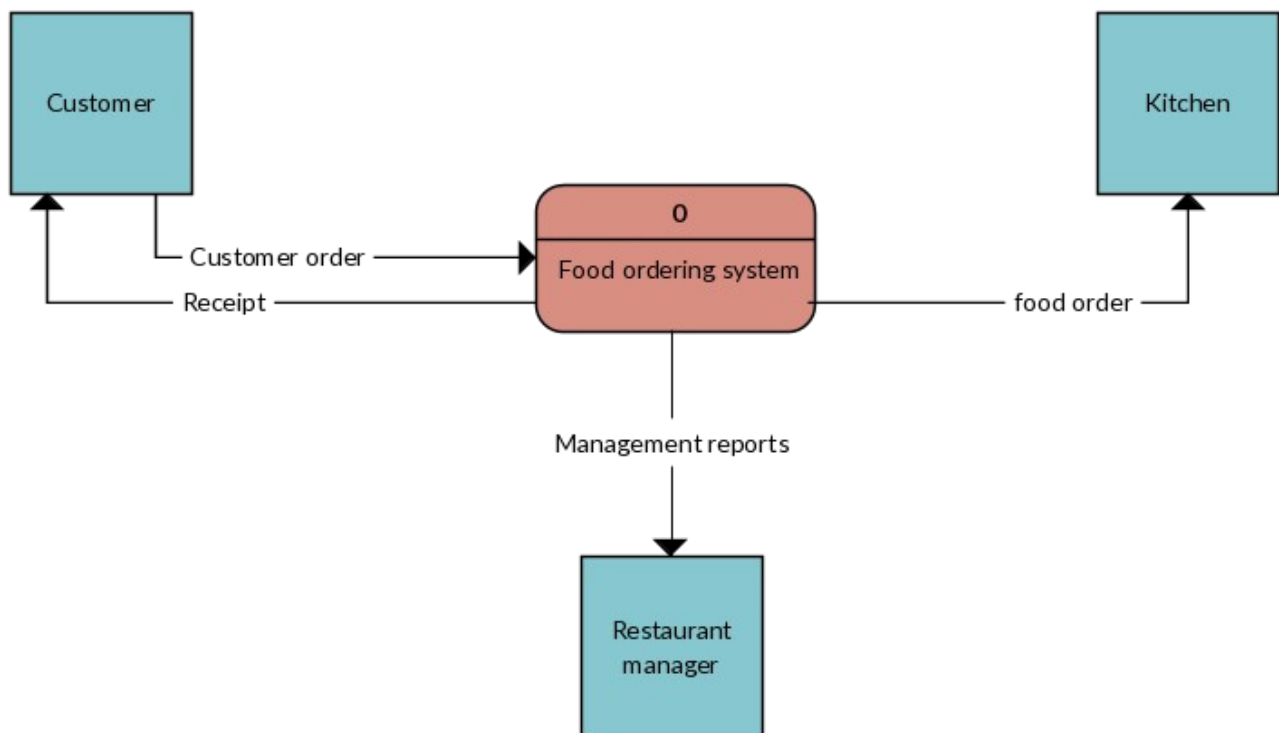

The reason why to choose this project is the idea behind project that is to solve problem of people which they are facing when they shift to different city. The system is not only for user but also for provider who provides food service. This system is for making efficient communication between consumer and producer of the food system which will then leads to the ideal and effective system.

How online food order system works

Step1: Using a customer mobile app, your customers browse your food menu on the smartphone. They select items & quantity to make a food order & pay for the order via mobile app. Upon payment confirmation, they are redirected to order confirmation information and Now they can track the order from their account. Tracking tree of the order shows all the information like Order received by the restaurant, Order is in preparation, order ready for delivery, order picked up by driver & confirmation on the delivery of the order.

•**Step 2:** After order confirmation, Order goes into Order management tablet app which is generally placed at the cash counter of a restaurant or in the kitchen. Staff can accept or deny the order with a note. Order management app has two options – Automatic print of new order via wireless thermal printer or can manually print the order via the wireless thermal printer. As soon as the staff accepts the order, it also goes automatically to the nearest available delivery boy which has been signed up with the system.

- Step 3:** During the preparation of the food, Restaurant staff can assign order delivery to the nearest available delivery guy manually or the delivery guy sees the order in his delivery guy app and can assign himself to deliver the order.
- Step 4:** Delivery boy reaches the restaurant and picks the order for delivery to the customer given address. Customers can see live movements of the delivery boy with an estimated time of arrival on the map interface.
- Step 5:** Order will be delivered to customer address and driver mark delivery completion on their delivery guy mobile app.

Software requirement:-

for the effective implementation of the new system, the following software has to be installed on the computer

- Windows Xp, Windows 7 or Vista
- MySql
- PhpMyadmin

Hardware requirements:-

- 1gb or above
- 40gb hard disk

- mouse
- keyboard

Choice of programming language:-

So many programming languages were put into consideration in the cause of designing this software. A lot of factors were also considered which includes the online database access, data transmission via networks, online database retrieval, online data capture, multi user network access database security, etc.

Package Required:-

1) Language used

- php
- html
- css
- mysql
- javascript

2). platform used

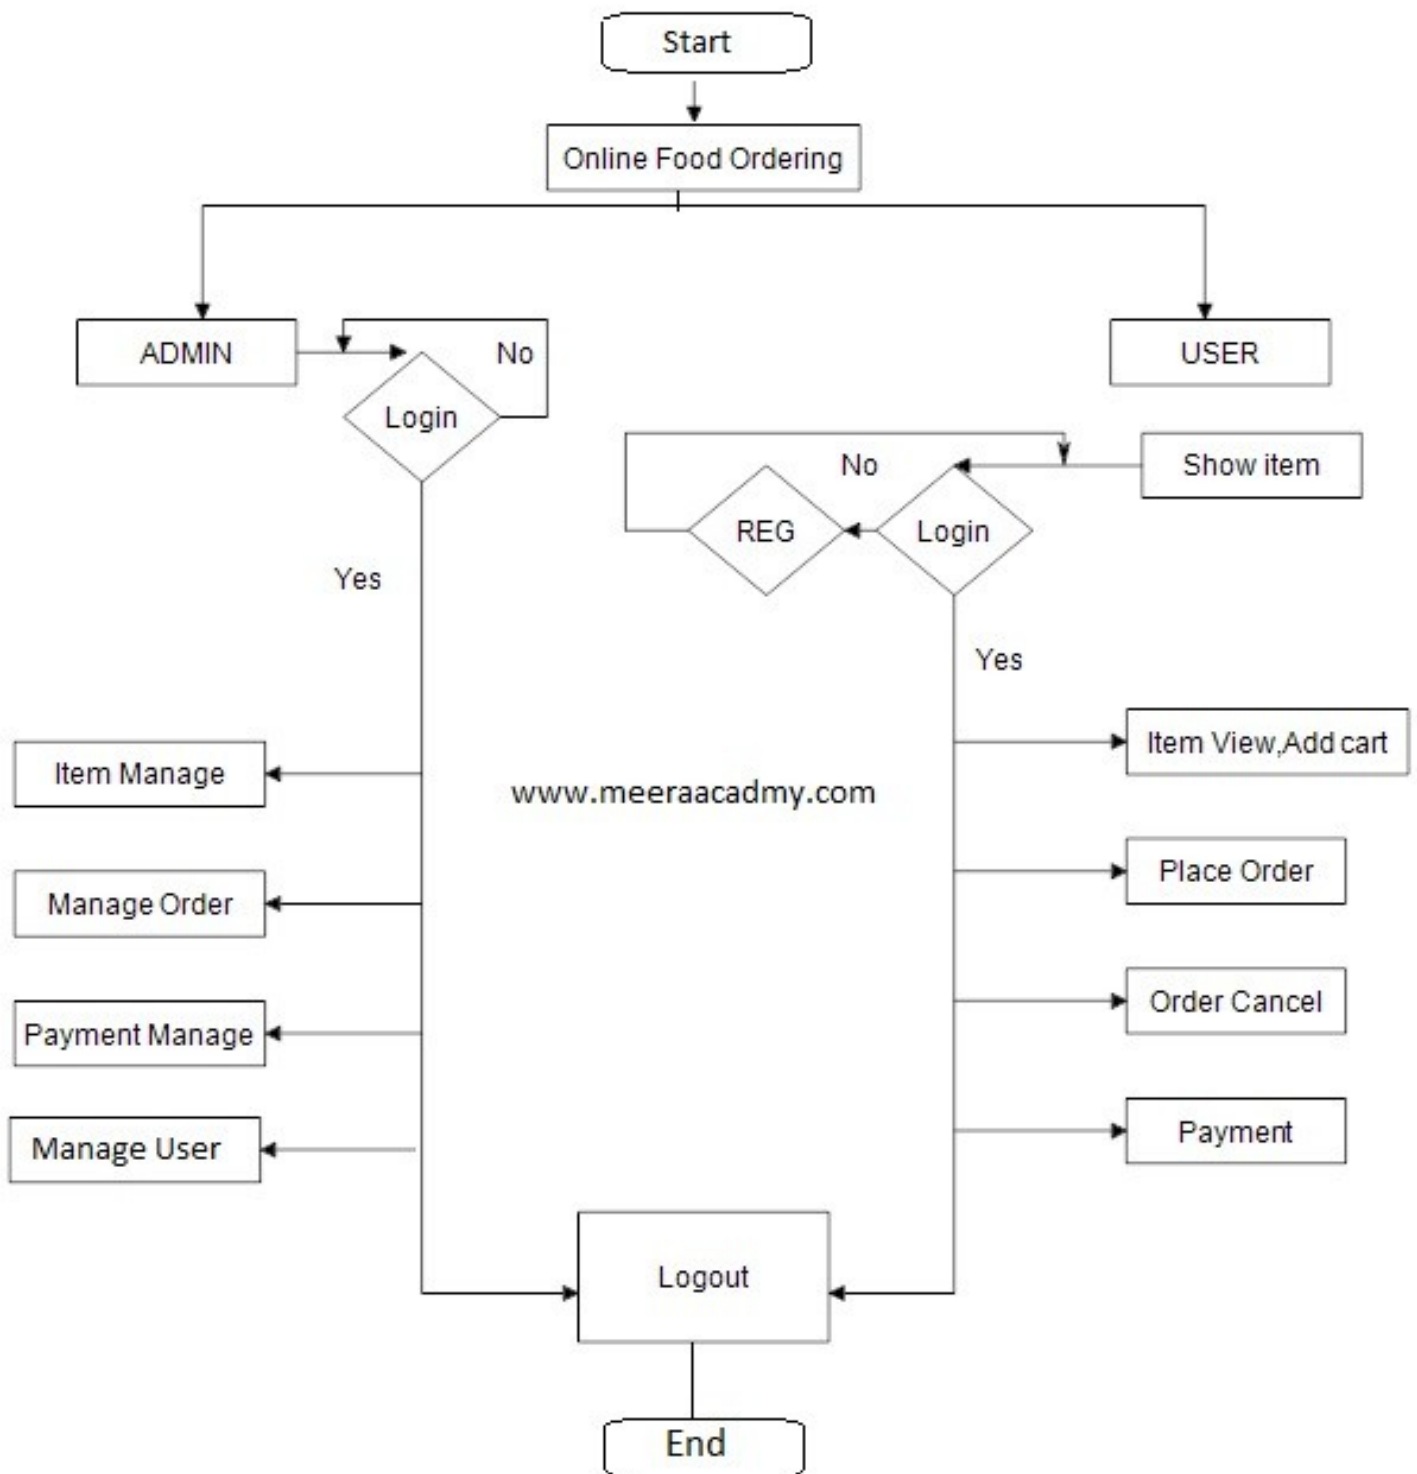

1. notepad
2. chrome

Problem Statements:-

As industries are fast expanding, people are seeking for more ways to purchase products with much ease and still maintain cost effectiveness. The vendors need to purchase the products in order to sell to end users. The manual method of going to their local food sales outlets to purchase food is becoming obsolete and more tasking. Food can be ordered through the internet and payment made without going to the restaurant or the food vendor. So there is need for a wide range of publicity and enabling direct order, processing and delivering of food through online system. For this system, there will be a system administrator who will have the rights to enter the menu with current prevailing price.
